## SAFETY PRECAUTIONS

Each Entertainment-Lodestar Electric Hoist is built in accordance with the specifications contained herein and at the time of manufacture complied with our interpretation of applicable sections of the *American Society of Mechanical Engineers Code B30.16 "Overhead Hoists", the National Electrical Code (ANSI/NFPA 70), the Occupational Safety and Health Act, British Health Safety Executives, TUV and CE Directive. Since OSHA states the National Electrical Code applies to all electric hoists, installers are required to provide current overload protection and grounding on the branch circuit section in keeping with the code. Check each installation for compliance with the application, operation and maintenance sections of these articles.
The safety laws for elevators, lifting of people and for dumbwaiters specify construction details that are not incorporated in CM hoists. For such applications, refer to the requirements of applicable state and local codes, and the American National Safety Code for elevators, dumbwaiters, escalators and moving walks (ASME A17.1). Columbus McKinnon Corporation cannot be responsible for applications other than those for which CM equipment is intended.
*Copies of this Standard can be obtained from ASME Order Department, 22 Law Drive, Box 2300, Fairfield, NJ 07007-2300, U.S.A.

A

## THIS SYMBOL POINTS OUT IMPORTANT SAFETY INSTRUCTIONS WHICH IF NOT FOLLOWED COULD

 ENDANGER THE PERSONAL SAFETY AND/OR PROPERTY OF YOUR SELF AND OTHERS. READ AND FOLLOW ALL INSTRUCTIONS IN THIS MANUAL AND ANY PROVIDED WITH THE EQUIPMENT BEFORE ATTEMPTING TO OPERATE YOUR LODESTAR HOIST.
## A WARNING

Usage of hoists that do not involve lifting of the load on the lower hook or using hoists in the hoist down position without special precaution may cause an accident resulting in injury and/or property damage.

## A WARNING

Improper operation of a hoist can create a potentially hazardous situation which, if not avoided, could result in death or serious injury. To avoid such a potentially hazardous situation, the operator shall:

1. NOT lift people.
2. NOT allow people on unsecured load without fall protection.
3. NOT exceed rated capacity of hoist.
4. NOT remove or obscure any capacity or warning label.
5. Check the supporting structure. The connection between the load hook and structure. The load itself and the connection between the hoist support and the load for their ability to withstand the loads imposed with an adequate design factor.
6. Tie off the load with auxiliary chains or cables before access to the area beneath the load is permitted. As an alternative, the system may be designed such that malfunction or failure of one hoist's load bearing components does not cause load loss and/or overloading of any other hoists in the system. Note that in such a system, hoist performance and function must be monitored visually or with use of load cells.
7. Read hoist manual and special instructions before installing and operating the hoist.

## Successful Theatrical Hoist Down Operation Requires the following actions:

At the loose end, maintain a minimum of 24 inches ( 61 cm ) of chain freely hanging over the side of hoist.

Keep load chain well lubricated using Lubriplate ${ }^{\circledR}$ 10R Bar and Chain oil.

Do make sure hoist is phased properly and chain travel limits function properly.
If a chain container is used, inspect before each use for damaged, loose hardware and water drainage provisions. Make certain container attachment hardware has an adequate design factor of a minimum of 5 to 1. Also, make sure chain container is of sufficient capacity: chain in fully loaded container shall not exceed 75\% of container height.

## A WARNING

Improper operation of a hoist can create a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. To avoid such a potentially hazardous situation, the operator shall:

1. Maintain a firm footing or be otherwise secured when operating the hoist.
2. Check brake function by tensioning the hoist prior to each lift operation.
3. Use hook latches. Latches are to retain slings, chains, etc. under slack conditions only.
4. Make sure the hook latches are closed and not supporting any parts of the load.
5. Make sure the load is free to move and will clear all obstructions.
6. Avoid swinging the load or hook.
7. Make sure hook travel is in the same direction as shown on the controls.
8. Inspect the hoist regularly, replace damaged or worn parts, and keep appropriate records of maintenance.
9. Use CM parts when repairing the unit.
10. Lubricate load chain per instructions in this manual.
11. NOT use the hoist load limiting or warning device to measure load.
12. NOT use limit switches as routine operating stops. They are emergency devices only.
13. NOT allow your attention to be diverted when operating hoist.
14. NOT allow the hoist to be subjected to sharp contact with other hoists, structures, or objects through misuse.
15. NOT adjust or repair the hoist unless qualified to perform such adjustments or repairs.

## FOREWORD

This manual contains important information to help you properly install, operate and maintain your hoist for maximum performance, economy and safety.

Please study its contents thoroughly before putting your hoist into operation. By practicing correct operating procedures and by carrying out the recommended preventive maintenance suggestions, you will experience long, dependable and safe service. After you have completely familiarized yourself with the contents of this manual, we recommend that you carefully file it for future reference.

The information herein is directed to the proper use, care and maintenance of the hoist and does not comprise a handbook on the broad subject of rigging.
Rigging can be defined as the process of lifting and moving heavy loads using hoists and other mechanical equipment. Skill acquired through specialized experience and study is essential to safe rigging operations. For rigging information, we recommend consulting a standard textbook on the subject.

## LODESTAR D8+

According to VPLT.SR2.0 and SQP2, D8 Plus chain hoists are used to lift loads during set-up and have the special characteristic of being able to hold loads at rest above people, without using a secondary component. The Lodestar D8+ has a minimum of 10:1 design factor, double brakes, and a clutch outside of the load path (when power is disconnected), per the requirements of the German Code of Practice, VPLT.SR2.0.

## ACCESSORIES

## HOOK SUSPENSIONS

Swivel and rigid type hook suspensions (see Figure 1) are available for all Lodestar Electric Hoists. However, swivel type hook suspensions are normally recommended for most applications.

Figure 1. Hook Suspensions

## LATCHLOK®HOOKS

CM's Latchlok hooks (see Figure 2) are available to replace the standard upper and lower hooks used on the Lodestar Electric Hoists.

## INSTALLATION

## UNPACKING INFORMATION

When received, the hoist should be carefully inspected for damage which may have occurred during shipment or handling. Check the hoist frame for dents or cracks, the external cords for damaged or cut insulation, the control station for cut or damaged enclosure, and the load chain for nicks and gouges. If shipping damage has occurred, refer to the packing list envelope on the carton for claim procedure.

Before using the hoist, make sure the voltage change board is connected for the intended power supply the hoist is to be operated.
NOTE: See Electrical Installation instructions.

## INSTALLING THE SUSPENSION (If Applicable)

## A. Single Reeved Units For Models B, C, F, J, JJ, L, \& LL:

Remove the hook suspension and (2) suspension screws from the packaging. Place the suspension assembly into the recess on top of the hoist so that the adapter body follows the contour of the hoist. Insert the suspension screws through the holes in the adapter and hand thread these into the self-locking nuts enclosed in the hoist. The screws will turn freely into the nuts until the last 1/4" ( 6.35 mm ) of travel, during which the resistance of the nut locking collar will be encountered.

> Use of impact tools (electric or pneumatic) may cause premature failure of attaching hardware.

Securely tighten the screws to the recommended seating torque (see Table 2) using a 12 point socket $3 / 8^{\prime \prime}$ for Models B, C, and F and $1 / 2^{\prime \prime}$ for Models J, L, LL, R and RR and $3 / 16^{\prime \prime}$ hex bit socket for Model RRS."

For Model RRS: Remove the hook suspension, screw and locknut from the packaging. Slide the suspension assembly into the channel in the top of the hoist. Insert the locknut into the hex recess on the side of the suspension riser, insert the screw through opposite side and hand thread the screw into the self-locking nut. Tighten to recommended torque.

## B. Double Reeved Units:

Remove the hook suspension, (2) suspension screws, (1) dead end pin, (1) washer, and (1) cotter pin from the packaging. It should be noted that the suspension includes a dead end bolt and block for supporting the dead end of the load chain as shown in Figure 3. Place the suspension assembly into the recess on top of the hoist. The dead end block should project through the bottom of the hoist with the pin hole and slot aligned to the underside of the hoist as shown in Figure 3.
If these are not aligned as shown, lift the head of the bolt from the hex recess in the adapter and turn the bolt and block assembly and reseat the bolt head to obtain the proper alignment. Do not change the position of the dead end block on the bolt to attain this alignment.
Check the position of the pin hole in the dead end block to make sure it has not been disturbed from its factory setting. The distance from the top of the pin hole to the bottom of the hoist should not exceed 7/16" ( 11.11 mm ) for the Models R and RR. If the distance is not correct, adjust the position of the dead end block to obtain the proper distance (see Figure 14, Page 26).
Now, insert the suspension screws through the holes in the adapter and hand thread these into the self-locking nuts enclosed in the hoist frame. The screws will turn freely into the nut until the last $1 / 4^{\prime \prime}(6.35 \mathrm{~mm})$ of travel during which the resistance of the nut locking collar will be encountered. Securely tighten the screws to the recommended seating torque (see Table 2) using a 12 point socket $3 / 8^{\prime \prime}$ for Models B, C \& F and 1/2" for Models J, L, LL, R and RR.
The dead end of the load chain is temporarily positioned (a few links from the end) by a wire tie. Do not remove this tie before attaching the chain to the dead end block. (See Fig.7).

*All Torque values are for clean,dry fasteners. DO NOT apply oil or any other lubricant to the fastener threads

## A WARNING

Using other than CM supplied high strength suspension screws to attach the suspension adapter to the hoist may cause the screws to break and allow the hoist and load to fall.

## TO AVOID INJURY:

Use only the CM supplied suspension screws to attach the suspension to the hoist and hand torque these screws to the recommended seating torque as specified in tables $2 \mathrm{a}, 2 \mathrm{~b}$, 2c, \& 2d.

DO NOT apply any type of lubricant to the threads of these screws. Lubricating the threads will reduce the effort to seat the screws and as a result, tightening the screws to the above recommended torque may break the screw, damage the suspension adapter, strip the nuts and/or damage the hoist frame.

SUSPENSION BOLT SHOULD BE REPLACED ANY TIME THE SUSPENSION IS REMOVED FROM THE HOIST.

## ATTACHING LOAD CHAIN

The Double Reeved Units are shipped with the dead end of the load chain temporarily connected to the bottom of the hoist by a wire tie (1) as shown in Figure 3. The wire tie is located a few links from the end of the chain, and it should not be removed until the chain is to be attached to the dead end block (2). To attach the chain to the dead end block, proceed as follows (not shown):

1. Suspend the hoist from an adequate support.
2. The hoist is shipped with the dead end of the load chain temporarily positioned a few links from the end by a wire tie (1) as shown in Figure 3. Do not remove this wire tie until the chain is secured. (not shown)
3. Do not remove the wire ties from the load chain at this time.

See page 27 for further instructions.
CHECKING FOR TWIST IN LOAD CHAIN MODELS R, RR
The best way to check for this condition is to run the lower hook, without a load, up to within about 2 feet (. 61 Meters) of hoist. If the dead end of the chain has been properly installed, a twist can occur only if the lower hook block has been capsized between the strands of chain. Reverse capsize to remove twist.

## CHAIN STOP KIT

Place polyurethane stop block over loose end of chain and slide past desired spot that the chain stop is to be located. Place one half of chain stop on chain. Then place other half on top of the first half of chain stop. (Note: Be sure that the half circle cut out side of one stop block half is aligned with hex cut out side.) Place one (1) nut into hex cutout insert one (1) screw with one (1) lock washer through hole opposite nut and loosely tighten. Repeat for second connection. Tighten both screw connections to ensure that they do not come loose.

## POWER SUPPLY AND

## ELECTRICAL CONNECTIONS

The hoist should be connected to a branch circuit which complies with the requirements of the National Electrical Code and applicable local codes.

It is recommended, especially for a single phase hoist with a (1) horsepower motor (. 75 Kilowatts), that a line of adequate capacity be run directly from the power supply to the hoist to prevent problems with low voltage and circuit overloads.
For grounding of the hoist, the power cord includes a grounding conductor (green yellow, G-Y). Before connecting the hoist to the power supply, check that the power to be used agrees with the position of voltage change plug on the voltage change board. The nominal hoist voltage rating corresponding to the voltage range given on hoist identification plate is:

| Dual Voltage Units |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Low | Range | Nominal <br> Volts | High | Range | Nominal <br> Volts |  |
|  | $220-240$ | 230 |  | $380-415$ | 400 |  |
|  |  | $440-480$ |  |  |  |  |

## THREE PHASE HOIST

Unless ordered on a special basis, all single speed/dual voltage (230/460-3-60, 220/380-3-50 and 220/415-3-50) North American hoist are factory arranged to operate on 230-3-60 (or 380-3-50 or 415-3-50). Dual voltage D8 and D8+ units are factory arranged to operate at 415-3-50 (220-3-50). However, a voltage change board is provided to easily and quickly change from 460 to 230 (or 380 to 220 or 415 to 220) volt operation. The voltage change board shown in Figure 5 is located in the hoist as shown in Figure 6.

Figure 5. Voltage Change Board

Figure 6. Location of Components
Voltage change board is located under back frame cover (1) for Models B, C \& F and under motor housing cover (2) for Models J, JJ, L, LL, R, RR, and RRS.
The voltage change board is color coded to indicate high and low volt connections. See Figure 5 Voltage Change Board. Connecting the 9 and 12 pin plugs into the "Red" voltage change board receptacles will connect the hoist for high voltage (380-3-50, 415-3-50 or 460-3-60). To change the hoist voltage to low voltage (208-3-60, 220-3-50 or 230-3-60) simply remove the 9 and 12 pin plugs from the "Red" receptacles and insert same into the "White" receptacles located on the voltage change board.
Be sure to make a notation of the new hoist voltage on the tag attached to the power cord. Direct Control hoist are voltage specific and factory wired at 460-3-60 (380-3-50 or 415-3-50).

## PROPER PHASING

Since the motor in a three phase hoist can rotate in either direction depending on the manner in which it is connected to the power supply. The direction of hook movement must be checked prior to each usage.
NOTE: Serious damage can result if the hook is run to the upper or lower limit of travel with the hook operating in a direction opposite to that indicated by the control station. Therefore, proceed as follows:

1. Make temporary connections at the power supply.
2. Operate $\uparrow$ (UP) control momentarily. If hook raises, connections are correct and can be made permanent.
3. If hook lowers, it is necessary to change direction by inter-changing the Grey lead and the Black lead of hoist power supply. Under no circumstances should the internal wiring of the control device or hoist be changed to reverse hook direction. The wiring is inspected and tested before leaving the factory.
Do not force the Lodestar Load-limiter to compensate for improperly adjusted limit switches or reverse voltage phasing.

## A WARNING

Allowing the hook block to run into the bottom of the hoist when raising a load or allowing the chain to become taut between the loose end screw and the frame when lowering a load may break the chain and allow the load to drop.

## TO AVOID INJURY:

Do not allow the hook block to contact the bottom of the hoist or the loose end chain to become taut.

## CHECKING FOR ADEQUATE VOLTAGE AT HOIST

The hoist must be supplied with adequate electrical power in order to operate properly. For proper operation, the voltage, (measured at the hoist end of the standard power cord with the hoist operating in the $\uparrow$, up direction with full load) must be as indicated in the table below.

| NOMINAL <br> VOLTAGE | MINIMUM RUNNING <br> VOLTAGE |
| :---: | :---: |
| $115-1-60$ | 104 |
| $230-1-60$ | 207 |
| $230-3-60$ | 187 |
| $460-3-60$ | 396 |
| $220-3-50$ | 198 |
| $380-3-50$ | 365 |
| $415-3-50$ | 399 |

## SIGNS OF INADEQUATE ELECTRICAL POWER (LOW VOLTAGE) ARE:

- Noisy hoist operations due to brake and/or contactor chattering.
- Dimming of lights or slowing of motors connected to the same circuit.
- Heating of the hoist motor and other internal components as well as heating of the wires and connectors in the circuit feeding the hoists.
- Failure of the hoist to lift the load due to motor stalling.
- Blowing of fuses or tripping of circuit breakers.

To avoid these low voltage problems, the hoist must be connected to an electrical power supply system that complies with the National Electrical Code and applicable local codes. This system must also provide (slow blow fuses or inverse-time type circuit breakers) and provisions for grounding the hoist.

| Failure to properly ground the hoist presents the danger of <br> electric shock. <br> TO AVOID INJURY: <br> Permanently ground the hoist as instructed in this manual. |
| :--- |

Low voltage may also be caused by using an undersized cord and/or connectors to supply power to the hoist. The following chart should be used to determine the size wires in the extension cord in order to minimize the voltage drop between the power source and the hoist.

| LENGTH OF EXTENSION CORD | THREE PHASE HOISTS | SINGLE PHASE HOIST |
| :---: | :---: | :---: |

| A M/ARETAC |  |  |
| Failure to provide a proper power supply system for the hoist may cause hoist damage and offers the potential for a fire. |  |  |
| TO AVOID INJURY: |  |  |
| Provide each hoist with a 20 amp , minimum, overcurrent protected power supply system per the National Electrical Code and applicable local codes as instructed in this manual. |  |  |

Remember, operation with low voltage can void the CM repair/ replacement policy. When in doubt about any of the electrical requirements, consult a qualified electrician.

## 4 (2) WARNING

## TO AVOID INJURY:

Always disconnect the power cord from the power supply system and lockout/tagout disconnecting means before servicing the hoist. Working in or near exposed energized electrical equipment presents the danger of electric shock.

## CHECKING LIMIT SWITCH OPERATION IF HOIST IS EQUIPPED

With hoists that are equipped with an adjustable screw limit switch, the limit switch will automatically stop the hook at any predetermined point when either hoisting or lowering.

## A WARNING

Failure to properly ground the hoist presents the danger of electric shock.

## TO AVOID INJURY

Permanently ground the hoist as instructed in this manual.
Operate hoist over the entire length of its rated lift, checking upper and lower limit switches for correct operation as follows:

1. Press (UP) control and raise the lower hook until top of hook block is about 12 inches ( 305 mm ) below the hoist.
2. Cautiously continue raising the hook until the upper limit switch stops the upward motion. The upper limit switch is set at the factory to stop the hook block 8 links from the bottom of all hoists.
3. If adjustment is necessary, see page 14.
4. Press(DOWN) control and cautiously lower hook until lower limit switch stops the downward motion. On hoist operated in the motor down orientation, maintain a minimum of 24 " ( 610 mm ) of chain freely hanging over the side of the hoist.
5. If adjustment is necessary, see page 14.

NOTE: If the hoist is equipped with a chain container/bag, reset the upper and lower limit switches as indicated on page 14.

Under no condition should the hook block or load be permitted to come in contact with the chain container/bag. If contact is made, the function of the chain container can be interfered with and its fasteners imperiled.

NOTE: When chain bag is filled to capacity the bag must be no more than 75\% filled.

## OPERATING INSTRUCTIONS

## GENERAL

1. The Load-limiter is designed to slip on an excessive overload. An overload is indicated when the hoist will not raise the load. Also, some clutching noise may be heard if the hoist is loaded beyond rated capacity. Should this occur, immediately release the $\uparrow$ (UP) control to stop the operation of the hoist. At this point, the load should be reduced to the rated hoist capacity or the hoist should be replaced with one of the proper capacity. When the excessive load is removed, normal hoist operation is automatically restored.

CAUTION: The Load-limiter is susceptible to overheating and wear when slipped for extended periods. Under no circumstance should the clutch be allowed to slip for more than a few seconds.
Due to the above, a hoist equipped with a Load-limiter is not recommended for use in any application where there is a possibility of adding to an already suspended load to the point of overload. This includes dumbwaiter installations, containers that are loaded in mid-air, etc.

## SAFE OPERATING INSTRUCTIONS AND PROCEDURES

For safety precautions and a list of Do's and Do Not's for safe operation of hoists, refer to page 3.

1. Permit only competent personnel to operate unit.
2. When preparing to lift a load, be sure that the attachments to the hook are firmly seated in hook saddle. Avoid off center loading of any kind, especially loading on the point of hook.
3. Do not allow the load to bear against the hook latch. The latch is to help maintain the hook in position while the chain is slack before taking up slack chain.
4. Do not wrap the load chain around the load and hook onto itself as a choker chain. Doing this will result in:
a. The loss of the swivel effect of the hook which could result in twisted chain and a jammed lift wheel.
b. The upper limit switch, if so equipped, is bypassed and the load could hit the hoist.
c. The chain could be damaged at the hook.
5. Before lifting load, check for twists in the load chain. On double reeved units A twist can occur if the lower hook block has been capsized between the strands of chain. Reverse the capsize to remove twist.
6. On single reeved chain hoist used in conjunction with head blocks and ground support systems, check for twists between the hoist and head block. Twisted load can result in a jammed liftwheel.
7. Do not use this or any other overhead materials handling equipment for lifting persons.
8. Do not load hoist beyond the rated capacity shown on hoist identification plate or on the hoist motor housing cover or hoist back frame cover. Overload can cause immediate failure of some load-carrying part or create a defect causing subsequent failure at less than rated capacity. When in doubt, use the next larger capacity CM Lodestar Hoist.
9. Warn personnel of your intention to lift a load in the area. Tie off the load with auxiliary chains or cables before access to the area beneath the load is permitted.
10. Do not operate hoist at unusual extremes of ambient temperatures above $150^{\circ} \mathrm{F}\left(60^{\circ} \mathrm{C}\right)$ or below $0^{\circ} \mathrm{F}\left(-17^{\circ} \mathrm{C}\right)$.

## 11. Removing Hoist From Road Case and Operating on Stage

Hoists can be removed from the road case by manual lifting, or rigged while still in the case and power out.

Manual Lifting - It is recommended that two people be used to the lift the hoist from the road case. The hoist can be lifted by grasping the handles (if fitted), the end covers, or the load chain. Never pull on the electrical cable(s) even if equipped with an external strain relief.

When placed on the floor the hoist should be positioned on its side with the chain pulled away to allow the chain to enter the hoist without jamming if the hoist is to be operated.

## A WARNING

Never operate a Lodestar hoist while standing on its end as in the figure to the right.
The hoist may tip over and damage the casing, but more importantly it will cause the Lodestar to "drag" against its brake putting extra strain on the electric motor.

When running chain "in" the hoist should be laid on its side on the ground / stage with the chain stretched out along the ground. The "dead" end side of the hoist should be on the floor. With the hoist in this position, gravity will hold the chain and allow it to run freely through the hoist and help unravel any twists and prevent chain jam.

CDESAR

When running chain "out", the same principal should be adopted but this time with the "dead" end side of the hoist facing up. Again, this will prevent twists causing chain jam.

When using Lodestar hoists with 2 chain falls (for example on Model R or RR) you should check for twists in the chain. The best way to check for this condition is to run the lower hook up (without load) to within about 24 inches ( 600 mm ) of the hoist when any twists will become apparent, if the chain has been properly installed a twist can only occur if the lower block has been capsized between the strands of chain - reverse capsize to remove twists.

- Before moving a truss use a verbal warning such as "truss moving". Always "bump" the hoists before lifting or lowering. This will do 2 things:
- It will act as a warning to people around that the rig is about to move should they not have heard your warning.
- Any problem with rigging or reeving will show up in this "bumping through" - always leave enough chain to "bump" without running out of chain.
- Always have one person in charge of moving the rig, but as many "spotters" as necessary to watch any hoists the main person cannot see.
- When replacing the hoist in the road case, the chain should be run to the lower limit then operated in the up direction for about $6(152 \mathrm{~mm})$ to $8(203 \mathrm{~mm})$ inches. This should be done because:
- The ceiling height may be lower in this venue than the next. If you run all the chain out, this assures enough chain for the rigger to hit the point in the next venue regardless of the height.
- Running off the lower limit prevents any damage to the micro switch due to vibration as the hoist travels to the next venue.

## A WARNING

Allowing the load to bear against the hook latch and/or hook tip can result in loss of load.

## TO AVOID INJURY:

Do not allow the load and/or attachments to bear against the hook latch and/or hook tip. Apply load to hook bowl or saddle only.
12. Take up a slack load chain carefully and start load easily to avoid shock and jerking of hoist load chain. If there is any evidence of overloading, immediately lower the load and remove the excess load.
13. When lifting, raise the load only enough to clear the floor or support and check to be sure that the attachments to the hook and load are firmly seated. Continue lift only after you are assured the load is free of all obstructions.
14. Do not allow the load to swing or twist while hoisting.
15. Never operate the hoist when flammable materials or vapors are present. Electrical devices produce arcs or sparks that can cause a fire or explosion.
16. STAY ALERT! Watch what you are doing and use common sense. Do not use the hoist when you are tired, distracted or under the influence of drugs, alcohol or medication causing diminished control

## INSPECTION

To maintain continuous and satisfactory operation, a regular inspection procedure must be initiated to replace worn or damaged parts before they become unsafe. Inspection intervals must be determined by the individual application and are based on the type of service to which the hoist will be subjected.

The type of service to which the hoist is subjected can be classified as "Severe, "Normal", "Stand-by", "Rental", or "Out of Service".
Stand-by Service: Hoist operates 25 or fewer days a year, but at least once.

Rental Service: Hoist is operated on an irregular schedule determined by rental use.

Out of Service: Hoist does not operate for a period of a year or longer.
Normal Service: Hoist operates 200 or fewer days a year, but more than 25 .

Severe Service: Hoist operates in excess of 200 days a year.
Two classes of inspection - frequent and periodic - must be performed.
Frequent Inspections: These inspections are visual examinations by the operator or other designated personnel. Records of such inspections are not required. The frequent inspections are to be performed monthly for normal service, weekly to monthly for heavy service, and daily to weekly for severe service, and they should include those items listed on page 12.

Periodic Inspections: These inspections are visual inspections of external conditions by an appointed person. Records of periodic inspections are to be kept for continuing evaluation of the condition of the hoist. Periodic inspections are to be performed yearly for normal service, semi-annually for heavy service and quarterly for severe service, and they are to include those items listed on page 12.

CAUTION: Any deficiencies found during inspections are to be corrected before the hoist is returned to service. Also, the external conditions may show the need for disassembly to permit a more detailed inspection, which, in turn, may require the use of nondestructive type testing.

## PREVENTIVE MAINTENANCE

In addition to the above inspection procedure, a preventive maintenance program should be established to prolong the useful life of the hoist and maintain its reliability and continued safe use. The program should include the periodic and frequent inspections with particular attention being paid to the lubrication of the various components using the recommended lubricants (see page 14).

## HOOK INSPECTION

Hooks damaged from chemicals, deformations or cracks, or any visibly apparent bend or twist from the plane of the unbent hook, excessive opening or seat wear must be replaced. Also, hooks that are opened and allow the latch to not engage the tip must be replaced. Any hook that is twisted or has excessive throat opening indicates abuse or overloading of the unit. Inspect other load sustaining parts, hook block screws, load pins and hook block bodies for damage.
On latch type hooks, check to make sure that the latch is not damaged or bent and that it operates properly with sufficient spring pressure to keep the latch tightly against the tip of the hook and allow the latch to spring back to the tip when released. If the latch does not operate properly, it should be replaced. See Figure 7 to determine when the hook must be replaced.

SUSPENSION BOLTS SHOULD BE REPLACED ANY TIME THE SUSPENSION IS REMOVED FROM THE HOIST.

## HOOK REPLACEMENT CRITERIA

Based on ASME B30.10, hooks shall be removed from service if damage such as the following is visible and shall only be returned to service when approved by a qualified person:

1. Missing or illegible rated load identification or illegible hook manufacturers' identification or secondary manufacturer's identification.
2. Excessive pitting or corrosion. Cracks, nicks, or gouges.
3. Wear--any wear exceeding $10 \%$ of the original section dimension of the hook or its load pin.
4. Deformation--any visibly apparent bend or twist from the plane of the unbent hook.
5. Throat opening-any distortion causing an increase in the throat opening of $5 \%$, not to exceed $1 / 4^{\prime \prime}$ ( 6 mm ).
6. Inability to lock- any self-locking hook that does no lock.
7. Inoperative latch, any damaged latch or malfunctioning latch that does not close the hook's throat.
8. Thread wear, damage, or corrosion.
9. Evidence of excessive heat exposure or unauthorized welding.
10. Evidence of unauthorized alterations such as drilling, machining, grinding, or other modifications.

|  | $(38.1 \mathrm{~mm})$ | $(36.2 \mathrm{~mm})$ | $(48.8 \mathrm{~mm})$ | $(23.9 \mathrm{~mm})$ |

## INSPECTING THE LOAD CHAIN:

The chain must be inspected at regular intervals, with a minimum of once annually. As the frequency of use increases, the time intervals between inspections must be reduced. During inspection, the chain link must be examined along their entire length, including the hidden parts. If the lifting equipment is frequently used with a constant lifting distance or in other words the switch from upward to downward often takes place in the same area, a particularly thorough inspection and lubrication is required in that area. Worn chain can also be an indication of worn hoist components. For this reason, the hoist's chain guides, hook blocks and liftwheel (sprocket) should be examined for wear and replaced as necessary when replacing chain.

1. Check to see if chain is dirty or poorly lubricated.
2. Clean the chain with a non-caustic/non-acid type solvent and make a link by link inspection for wear or cracks in the links, twisted or deformed links. Chain with any one of these defects must be replaced.
3. Slack the portion of the chain that normally passes over the lift-wheel (sprocket) or idler sprocket on multi-reeved hoist. Examine the chain links for wear (see figure 8). If the wire diameter anywhere on the link measures less than $90 \%$ of the nominal wire diameter, the chain must be replaced.

Figure 8. Chain Wear Areas
4. Based upon ASME B30.16, should also be checked for elongation. Select an unworn, unstretched length of the chain (at the slack end for example). Suspend the chain vertically under tension and using a knife blade caliper type gauge, measure the outside length of any convenient number of links, 11 is recommended. Measure the same number of links in the used sections and calculate the percentage in increased length. The chain should be replaced if the length of the used portion is more than $1.5 \%$ longer than the unused portion of the chain. Also, if the pitch of any individual link has elongated by more than $5 \%$, the chain should be replaced.

| Models | Pitch (P) | Diameter (D) |
| :---: | :---: | :---: |
| B, C \& F | $.745^{\prime \prime}(18.9 \mathrm{~mm})$ | $.250^{\prime \prime}(6.3 \mathrm{~mm})$ |
| $\mathrm{J}, \mathrm{JJ}, \mathrm{L}, \mathrm{LL}, \mathrm{R}, \& R R$ | $.858^{\prime \prime}(21.8 \mathrm{~mm})$ | $.312^{\prime \prime}(7.9 \mathrm{~mm})$ |
| RRS | $1.18^{\prime \prime}(30.0 \mathrm{~mm})$ | $.394(10.0 \mathrm{~mm})$ |

Figure 9. Gaging Load Chain Wear

Figure 10. Chain Embossing

Use only Star (*) grade load chain and original replacement parts. Use of other chain and parts may be dangerous and voids factory warranty.
IMPORTANT: Do not use replaced chain for other purposes such as lifting or pulling. Load chain may break suddenly without visual deformation. For this reason, cut replaced chain into short lengths to prevent use after disposal.

## A WARNING

Use Of Commercial Or Other Manufacturer's chain and parts to repair CM hoists may cause load loss.

## TO AVOID INJURY:

Use only CM supplied replacement load chain and parts. Chain and parts may look alike, but CM chain and parts are made of specific material or processed to achieve specific properties.

## MAINTENANCE

## LOAD-LIMITER

The Load-limiter should operate for the normal life of the hoist without service. The device has been calibrated at the factory for a specific model of hoist. For proper overload protection, be sure before installing a Load-limiter that it is correct for the unit. This is mechanical load protection only and contains no electrical sensing.

| Models | Load-limiter Part <br> Number | Load-limiter ID \# <br> (marked on Protecor) |
| :---: | :---: | :---: |
| B | C00000240 | 240 |
| C, F | C00000241 | 241 |
| J, L, R | C00000242 | 242 |
| JJ, LL, RR, \& RRS | C00000243 | 243 |

For appropriate D8+ Load-Limiter see parts blow-out.

## HOIST LUBRICATION

## A WARNING

The lubricants used in and recommended for the Lodestar Hoist may contain hazardous materials that mandate specific handling and disposal procedures.

## TO AVOID INJURY:

Handle and dispose of lubricants only as directed in applicable material safety data sheets and in accordance with applicable local, state and federal regulations.

## GEARS

NOTE: To assure extra long life and top performance, be sure to lubricate the various parts of the Lodestar Hoist using the lubricants specified in lubrication section. If desired, these lubricants may be purchased from CM. Refer to spare parts section for information on ordering the lubricants.
The gearbox is packed at assembly with grease and should not need to be renewed unless the gears have been removed from the housing and degreased.
If the gears are removed from the housing, wipe the excess grease off with a soft cloth and degrease the gears and housings. Upon reassembly, add grease to gears and housing. Fully coat gear teeth and pack gear box, Models B, C \& F require 7 fl . oz. of grease. Models J, JJ, L, LL, R, and RR require 15 fl . oz. of grease. For Model RRS hoist: A total of 22 fluid ounces of grease.

- The limit switch gears are of molded nylon and require no lubrication.
- Apply a light film of machine oil to the limit switch shaft threads at least once a year.

## BEARINGS

- All bearings and bushings, except the lower hook thrust bearing, are pre-lubricated and require no lubrication. The lower hook thrust bearing should be lubricated at least once a month.

## CHAIN GUIDES, LIFTWHEEL

## AND LOWER SHEAVE WHEEL

- When the hoist is disassembled for inspection and/or repair, the chain guides, lower sheave wheel (on double chain units) and liftwheel must be lubricated with Lubriplate Bar and Chain Oil 10-R (Fiske Bros. Refining Co. or equivalent) prior to reassembly. The lubricant must be applied in sufficient quantity to obtain natural runoff and full coverage of these parts.

## LOAD CHAIN

A small amount of lubricant will greatly increase the life of load chain. Do not allow the chain to run dry.

Keep it clean and lubricate at regular intervals with Lubriplate Bar and Chain Oil 10-4 (Fiske Bros. Refining Co.) or equal lubricant. Normally, weekly lubrication and cleaning is satisfactory, but under hot and dirty conditions, it may be necessary to clean the chain at least once a day and lubricate it several times between cleanings.
When lubricating the chain, apply sufficient lubricant to obtain natural run-off and full coverage, especially in the interlink area.

| Used motor oils contain known carcinogenic materials. |
| :--- |
| TO AVOID INJURY: |
| Never use used motor oils as a chain lubricant. Only use Lubriplate |
| Bar and Chain Oil 10-R as a lubricant for the load chain. |

## DC BRAKE ASSEMBLY

The correct air gap between field and armature is .008-. 018 in ( $0.2-0.45 \mathrm{~mm}$ ) for models B, C, \& F and .008-, 020 in (0.2-0.5 mm ) for models $J, J J, L, L L, R, R R, \& R R S$. The DC brake is not adjustable. As the friction material wears, the brake gap increases. If the maximum air gap is reached, a new friction disc/rotor should be installed.

## LIMIT SWITCH ADJUSTMENT

If limit switch operation has been checked as described on page 10 and is not operating correctly or is not automatically stopping the hook at a desired position, proceed as follows:

1. Disconnect hoist from power supply.
2. Remove back frame cover, see Figure 6.
3. The identification of upper and lower limit switches are indicated on the fiber insulator.
4. Loosen the 2 screws or spring back the rotatable guide to disengage the travel nut.

## SETTING UPPER LIMIT SWITCH

After completing steps 1 thru 4
5. Refer to table 3b-The "A" Dimensions given are the minimum distance that should be set between the top hook block and the bottom of the hoist.

## CAUTION: THE "A" DIMENSIONS SHOWN IN TABLE 3B ARE THE MINIMUM ALLOWED FOR SAFE OPERATION AND SHOULD NOT BE REDUCED.

6. Reconnect hoist to power supply.
7. Run hook to the desired upper position, cautiously operating the hoist without a load.
8. Disconnect hoist from power supply.
9. Moving one travel nut toward the other increases hook travel and away from the other decreases the travel. Now, turn the nut nearest the switch indicated as the "UPPER LIMIT SWITCH" until it just breaks the limit switch contacts, cautious not to allow the movement of the other travel nut if previously set. An audible click will be heard as the switch opens. Continue to rotate the nut toward the switch an additional one full tooth.

10. Securely reposition the guide plate in the slot
11. Reconnect hoist to power supply and check the stopping point of hook by first lowering the hook about 2 feet ( 61 cm ), then raise the hook by jogging cautiously until the upper limit switch stops upward motion. The stopping point of hook should be the desired upper position. If not, repeat the above instructions.
12. Double check setting by lowering the hook about 2 feet ( 61 cm ) and then run the hook into the upper limit with (UP) control held depressed.
13. Fine adjustment of the upper limit setting may be obtained by inverting the stationary guide plate in Step 10. The offset on the plate gives adjustments equivalent to $1 / 2$ notch, see Table 3B for the "Hook Travel Per Notch of Limit Switch Nut". When inverting the plate, it may be necessary to use the notch adjacent to the one used in the preliminary setting.

## SETTING LOWER LIMIT SWITCH

After completing steps 1 thru 4
5. Refer to Table 3B -The " B "dimensions given are the minimum length of loose end chain left on the loose side of the lift wheel when the hook is positioned at the lowest allowable hook position.
CAUTION: THE "B" DIMENSIONS SHOWN IN TABLE 3B ARE THE MINIMUM ALLOWED FOR SAFE OPERATIONS AND SHOULD NOT BE REDUCED.
6. Reconnect hoist to power supply.
7. Run hook to the desired lower position, cautiously operating the hoist without a load.
8. Disconnect hoist from power supply.
9. Moving one travel nut toward the other increases hook travel and away from the other decreases hook travel. Now, turn the nut nearest the switch indicated as the "LOWER LIMIT SWITCH" until it just breaks the limit switch contacts, cautious not to allow the movement of the other travel nut if previously set. An audible click will be heard as the switch opens. Continue to rotate the nut toward the switch an additional one full tooth.
10. Securely reposition the guide plate in the slot.
11. Reconnect hoist to power supply and check the stopping point of hook by first raising the hook about 2 feet $(61 \mathrm{~cm})$ then lower the hook by jogging cautiously until the lower limit switch stops downward motion. The stopping point of the hook should be the desired lower position, if not repeat the above instructions.
12. Double check setting by raising the hook about 2 feet ( 61 cm ) and then run the hook into the lower limit with (DOWN) control held depressed.
13. Fine adjustment of the lower limit setting may be obtained by inverting the stationary guide plate in Step 10. (Not available with the rotatable guide plate). The offset on the gives adjustments equivalent to $1 / 2$ notch, see Table 3 for the "Hook Travel Per Notch of Limit Switch Nut". When inverting the plate, it may be necessary to use the notch adjacent to the one used in the preliminary setting.

## CONVERTING LIMIT SWITCH GUIDES

1. Disconnect the hoist from the power supply system.
2. Refer to the exploded views and remove the back frame cover from the hoist.
3. Remove and discard the limit switch guide plate - retaining the 2 screws.
4. Refer to Figure 11A and 12A and assemble the limit switch guide plate to the limit switch bracket. Secure using the 2 screws.

## ELECTRICAL DATA

## TO DETECT OPEN AND SHORT CIRCUITS IN ELECTRICAL COMPONENTS

Open circuits in the coils of electrical components may be detected by isolating the coil and checking for continuity with an ohmmeter or with the unit in series with a light or bell circuit.
Shorted turns are indicated by a current draw substantially above normal (connect ammeter in series with suspected element and impose normal voltage) or D.C. resistance substantially below normal. The current method is recommend for coils with very low D.C. resistance.

Motor current draw in the stator should be measured with the rotor in place and running. Brake, relay and contactor coil current should be measured with the core iron in operating position.

## ASSEMBLY INSTRUCTIONS

## SWIVEL HOOK SUSPENSION

## Models R \& RR.

Assemble the dead end bolt and block through the suspension adapter as shown in Figure 14.

Figure 14. Swivel Hook Suspension

## INSTRUCTIONS FOR ASSEMBLING UPPER SUSPENSION TO HOIST dOUBLE REEVED CHAIN MODELS

Place the suspension assembly into the recess provided on the hoist. The dead end block should project through the bottom of the hoist with the pin hole and slot aligned to the underside of the hoist as shown in the Figure 4 page 7. If these are not aligned as shown, lift the head of the bolt from the hex recess in the adapter and turn the bolt and block assembly and reseat the bolt head to obtain proper alignment. DO NOT change the position of the dead end block on the bolt to attain this alignment.
Check the position of the pin hole in the dead end block to make sure that it has not been disturbed from its factory settings. The distance from the top of the pin hole to the bottom of the hoist should not exceed $7 / 16$ " (11mm) for Models R \& RR. If the distance is not correct, adjust the position of the dead end block to obtain the proper distance.

CAUTION: DO NOT apply oil or any other lubricant to the threads of the suspension adapter screws. Such lubricant will significantly affect the frictional characteristics and may damage the screw or nut if the screw is tightened to the recommended seating torques.
Now, insert the screws, supplied with the assembly, through the holes in the suspension adapter and thread these into the selflocking nut enclosed in the hoist. The screws will turn freely into the nut until the last $1 / 4$ " ( 6.35 mm ) of travel during which the resistance of the nut locking collar will be encountered. Securely tighten the screws to the recommended seating torque specified in Table 2, using a 12 point socket which fits the head of the screw.

## A WARNING

The suspension screws are special high strength screws and under no circumstances should screws other than these be used to attach the suspension to the hoist. If other than the supplied, high strength screws are used, they may break and allow the hoist to fall from the support and this may result in an accident that could cause injury and/or property damage.

SUSPENSION BOLT SHOULD BE REPLACED ANY TIME THE SUSPENSION IS REMOVED FROM THE HOIST

The dead end of the load chain is temporarily positioned (a few links from the end). DO NOT remove this clip before attaching the chain to the dead end block. Refer to Figure 3, page 7 and the tag attached to the load chain on the hoist.

See Tables 2 a and 2 b for recommended torque values.

## A WARNING

USE OF IMPACT TOOLS (ELECTRIC OR PNEUMATIC) MAY CAUSE PREMATURE FAILURE OF ATTACHING HARDWARE.

## Models B, C, F, J, JJ, L, \& LL

## INSTRUCTIONS FOR ASSEMBLING UPPER HOOK SUSPENSION TO HOIST SINGLE CHAIN MODELS

Place the suspension assembly into the recess on the top of the hoist so that the adapter body follows the contour of the hoist.
CAUTION: DO NOT apply oil or any other lubricant to the threads of the suspension adapter screws. Such lubricant will significantly affect the frictional characteristics and may damage the screw or nut if the screw is tightened to the recommended seating torques. Insert the screws, supplied with this assembly, through the holes in the adapter and thread these into the self-locking nuts enclosed in the hoist. The screws will turn freely into the nuts until the last $1 / 4$ " $(6.35 \mathrm{~mm})$ of travel during which the resistance of the nut locking collar will be encountered. Securely tighten the screws to the recommended seating torque specified in Table 2 a or 2 b , using a 12 point socket which fits the head of the screw.
For Model RRS: Remove the hook suspension, screw and locknut from the packaging. Slide the suspension assembly into the channel in the top of the hoist. Insert the locknut into the hex recess on the side of the suspension riser, insert the screw through opposite side and hand thread the screw into the self-locking nut. Securely tighten the screw to the recommended torque (see table 2), using a 3/16" hex bit socket.

## FASTENERS

See tables 2a, b, c and d for recommended torque values.

## LOWER HOOK BLOCK PIN

When removing or installing the lower hook pin, care must be taken so as to prevent damaging the pin and/or hook block. These pins are tapered groove pins and as a result, they can only be removed in one direction. To remove the pin, a V-Block, drift and hammer (or slow acting press) are required. The drift should be the same diameter as the pin ( $5 / 16$ " diameter ( 7.94 mm ) for Models B, C \& F and $3 / 8$ " ( 9.52 mm ) diameter for Models J, JJ, L, LL, R, \& RR, and $\left(7 / 16^{\prime \prime}\right.$ diameter ( 11.11 mm ) for Model RRS1 and it should be placed on the small end of the pin. The small end of the pin is the end opposite the end on which the 3 grooves are visible. Place the hook block in the V-Block and drive the pin out using the drift and a hammer or slow acting press.
To re-install the pin, the parts must be arranged the same as they were when the pin was removed. To do this, use the small end of the pin as a gage. First check the holes in the hook block body and determine which hole is the largest. Place the hook body in the V-Block with the larger hole on top. Next, check each end of the hole in the lower hook chain block and determine which end is the largest. Place the chain in the slot of the chain block and insert the chain block, with the large hole on top, into the hook block body. Align the holes in the hook block body with the hole in the chain block and insert the small end of the pin in the hole. Push the pin in by hand until it stops and then use a hammer or slow acting press to drive the pin into position so that the end of the pin is flush with the outside surface of the hook block body.

## A WARNING

Use of improper lower hook chain block pin as well as improper installation of the pin can cause the pin to break and allow the load to fall.

## TO AVOID INJURY AND PROPERTY DAMAGE:

Use only CM supplied, special high strength lower hook chain block pin to attach the chain to the lower hook block and install the pin as directed above.

## REMOVAL AND INSTALLATION OF LOAD CHAIN

 A WARNINGImproper installation (reeving) of the load chain can result in a dropped load.

## TO AVOID INJURY/DAMAGE:

- Verify use of proper size and type of hoist load chain for specific hoist.
- Install load chain properly as indicated below.

USE ONLY CM EN (formerly DIN) OR STAR ( $\star$ ) GRADE LOAD CHAIN AND CM REPLACEMENT PARTS. USE OF OTHER CHAIN AND PARTS MAY BE DANGEROUS AND VOIDS FACTORY WARRANTY.

A WARNING

USE OF COMMERCIAL OR OTHER MANUFACTURER'S
CHAIN AND PARTS TO REPAIR CM HOISTS MAY CAUSE
LOAD LOSS.

## TO AVOID INJURY:

Use only CM supplied replacement load chain and parts. Chain
and parts may look alike, but CM chain and parts are made of
specific material or processed to achieve specific properties.

Hoist load chain can be installed by any one of several methods.
The first method is recommended when replacing severely worn load chain and requires disassembling the hoist. Method 2 does not require hoist disassembly, where as Method 3 requires only partial disassembly.

## Method \#1

a. Disconnect hoist from power supply.
b. Remove back frame cover and disengage the limit switch guide plate from the traveling nuts, see page 15 or 16.
c. Detach loose end of load chain from hoist frame, see Figure 3. Also, on single reeved models, detach the lower hook block from the load chain (see page 44). On double reeved models R \& RR unfasten the dead end side of load chain.
d. Continue to disassemble the hoist and inspect the liftwheel, chain guides, motor housing and gear housing which if worn or damaged may cause premature failure of the new chain. Parts can be easily identified by referring to pages 30 thru 61.
e. If the liftwheel pockets, in particular the ends, are worn or scored, replace liftwheel. If chain guides and housing are worn, cracked or damaged these parts should also be replaced.
f. Reassemble hoist with the new load chain inserted over the liftwheel. Position chain with the weld on upstanding links away from liftwheel and leave only one foot of chain hanging free on loose end side. On double reeved models, make certain that the new load chain is free of twists.
g. Attach the loose end link to chain and connect it to the hoist frame with the loose end screw, washer and lockwasher, see Figure 3. BE CERTAIN THERE IS NO TWIST.
h. For single reeved models, attach the hook block to load chain (see page 44) and proceed to step K.
. For double reeved models, run the hoist (UP) until only 914.4 mm ( 36 " Inches) of chain remains on dead end side. This will minimize the chance of introducing a twist between hook block and hoist. Allow the chain to hang free to remove twists.
j. Using a wire as a starter, insert the chain, flat link first, into lower hook block (upstanding links will have weld toward sheave) and pull through. Insert last link into slot in dead end block making certain that no twist exists in the reeving at any point. Assemble dead end pin, washer and cotter pin as shown in Figure 3.
k. Adjust limit switches as describe in Table 3, page 15. If the new chain is longer than the old, check to be sure limit switch will allow for new length of lift. In the event maximum adjustment does not allow entire length of lift, check with $\mathrm{CM} ®$ for modification if necessary.

## A WARNING

Do not allow hook block to hit hoist or allow load chain to become taut between loose end screw and frame or else serious damage will result. If hook block should inadvertently hit the hoist-the hoist frames, load chain and hook block should be inspected for damage before further use.

## Method \#2

Treat the old load chain in hoist as a "starter chain" and proceed with steps from Method \#1, $a, b, c$ and $h$ thru $k$. If a starter chain is used, the loose end link (two links required for double reeved models) can serve as a temporary coupling link to connect together the starter chain in the hoist and the new load chain to be installed. Then, under power, reeve the new load chain through the liftwheel area, replacing the starter chain in unit. Run enough chain through to attach loose end link to hoist frame.

CAUTION: For double reeved models, be sure to disconnect one of the loose end links from the load chain before attaching it to the hoist.

## Method \#3

a. First proceed with Steps 1a, b \& c from Method \#1.
b. Then, carefully run the load chain out of the hoist.
c. Disconnect hoist from power supply.
d. Remove the electric brake assembly.
e. Rotate the brake hub by hand, at the same time feeding the load chain into and through liftwheel area with hoist upside down or using a wire to pull the load chain up onto the liftwheel as explained in Method \#1 step 1 f.
f. Refer to Method \#1 steps g thru j above to complete the installation.

## CUTTING CHAIN

$C M ® L o a d$ chain is hardened and it is difficult to cut. The following methods are recommended when cutting a length of new chain from stock or cutting off worn chain.

1. Use a grinder and nick the link on both sides (Figure 15), then secure the link in a vise and break off with a hammer.
2. Use a 177.8 mm ( 7 inches) minimum diameter by 3.175 mm ( $1 / 8$ inch) thick abrasive wheel (or type recommended by wheel supplier) that will clear adjacent links.
3. Use a bolt cutter (Figure 14) similar to the H.K. Porter No. 0590MTC with special cutter jaws for cutting hardened chain ( $25.4 \mathrm{~mm}-1$ inch) long cutting edge.

## A WARNING

Cutting Chain Can Produce Flying Particles.
TO AVOID INJURY:

- Wear Eye Protection.
- Provide A shield Over Chain to Prevent Flying Particles.

For Chain Stop Installation instructions, see page 8.

## A WARNING

Using "Commercial" or other manufacturer's parts to repair the CM Lodestar Hoists may cause load loss.

## TO AVOID INJURY:

Use only CM supplied replacement parts. Parts may look alike but CM parts are made of specific materials or processed to achieve specific properties

## ORDERING INSTRUCTIONS

The following information must accompany all correspondence orders for replacement parts:

1. Hoist Model Number from identification plate.
2. Serial number of the hoist stamped below identification plate.
3. Voltage, phase, hertz from the identification plate.
4. Length of lift.
5. Part number of part from parts list.
6. Number of parts required.
7. Part name from parts list.

NOTE: When ordering replacement parts, it is recommended that consideration be given to the need for also ordering such items as gaskets, fasteners, insulators, etc. These items may be damaged or lost during disassembly or just unfit for future use because of deterioration from age or service.
